

Unit 28 Environmental issues

Task 02 – Put the text pieces into the correct order.

KV zur Differenzierung: Schneiden Sie die Textteile aus und lassen Sie sie von schwächeren Schülerinnen und Schülern in die richtige Reihenfolge bringen.

Green Building
“Green Building” means that we construct houses with regard to the environment and we care about future generations.
A green building generates as little waste as possible during its construction, limits water consumption, makes maximum use of recycled, recyclable and non-toxic materials and optimises energy efficiency.
Electricity consumption has doubled over the last 20 years and this trend is going to continue.
This is why the use of solar power should be increased, as well as other forms of renewable energy like wind power, biomass power, geothermal power or hydro-electric power.
Furthermore, excellent insulation all over the building is required as well as high quality triple-glazed windows and a ventilation system with a high level of heat recovery to reduce the negative effects of heating.
Eco-builders make careful use of natural resources by applying the three Rs (reduce, reuse and recycle).
This strategy reduces costs relating to waste as well as those relating to CO2 emissions.
So let’s start to care about our Earth, stop global warming and save the environment.
